

The Blending of Firms to Augment Client Focus

For the past 33 years, Land Data Technologies Inc. (LDT) has been a leader in integrated land information products and services throughout the world.

Stewart Weir has a tremendous history, dating back to 1912, of providing client focused geomatics and engineering services in Western Canada.

On December 11, 2009 LDT became a wholly owned subsidiary of Stewart Weir to provide specialized land information solutions as well as offer added value through an integrated suite of services.

LDT Chief Executive Officer Ray Ferguson summarizes the acquisition as follows:

Blending the expertise and skills set of LDT and Stewart Weir into one organization expands the channel of services LDT can provide to our clients beyond mapping and aerial imagery. We now are able to increase our capabilities with the integration of survey, and engineering services. The clients of both company's can be assured that they have one knowledgeable point of contact for any mapping, imagery, geomatics, survey, and engineering services they may require.

Stewart Weir's Chief Business Officer Brian Pearse, P.Eng. gives his view of the new relationship:

LDT are known worldwide for applying leading edge technologies for the transformation of digital information. Blending these superior technical results with our internally emerging technologies such as 3D laser scanning and GIS, we believe, will provide outstanding products. We are really excited to have LDT personnel as part of the Stewart Weir family and we look forward to an excellent working relationship with these professionals.

Services:

- aerial photography
- digital cartography
- digital orthophotography
- mapping control
- engineering mapping
- softcopy photogrammetry
- topographic mapping
- non-topographic mapping
- remote sensing
